

MUST-HAVE ARTICLES CHECK

WORKING GROUP:

Group should identify five key articles that report on the measurement properties of the target instrument. These "must-have" articles may be sourced from

- Personal libraries of group members
- Instrument developers
- Official instrument websites
- Preliminary or informal literature searches

Once identified, the Working Group should check whether the final search strategy captures these articles. This process helps assess whether the search is sufficiently sensitive. If any of the articles are not retrieved, the search strategy should be revised accordingly.

Please document any revisions made to the search strategy. This information is essential for transparency in publication and for future reference.

Use the table below to track whether the "must-have" articles were captured by the search:

#	Citation or Title of Key Article	Captured by Search Strategy?
1		
2		
3		
4		
5
